                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and helminthic infections
                                                                                                                                                                                                                                                            Asthma; IL-5; interleukin-5; allergy; cytokine; helminthic infection; cancer; eosinophilia; vaccine; allergic rhinitis.

Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                          The invention provides carrier proteins comprising at least 5 CD4+ T cell epitope. The carrier protein comprises at least 1 of N6, N10 or N19. The carrier protein can be prepared by expressing a vector comprising a nucleic acid molecule encoding the protein, in a host cell and recovering the expressed protein. The carrier protein can also be produced by (a) constructing oligonucleotide molecules that encode peptide epitopes; (b) annealing the oligonucleotides for form duplexes; (c) introducing the duplexes into an expression vector; (d) introducing the duplexes into an expression vector; (d) introducing the expression vector into a host cell; and (e) isolating the fusion protein produced from a protective immunogen in the control of diseases caused by encapsulated bacteria. The present sequence represents the amino acid sequence of N6 polyepitope carrier protein construct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                      Carrier proteins containing CD4+ epitopes useful for protecting against diseases caused by encapsulated bacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Asthma, IL-5; interleukin-5; allergy; cytokine; helminthic infection; cancer; eosinophilia; vaccine; allergic rhinitis.

                                        The present sequence represents a modified human tumour necrosis factoralpha analogue. The analogues have no residual TNF activity and are immunogenic in a large proportion of the human population (by using promiscuous epitopes). The TNF-alpha analogue is able to generate, in humans, neutralizing antibodies to wild-type human TNF alpha, has at least one fragment of TNF substituted by a peptide containing an immunodominant T-cell epitope, and at least one TNF-alpha B-cell epitope. The substitution causes a significant change in the amino acid sequence of any one of the strands in the front beta-sheet, any of the connecting loops or any of the B', I or D strands in the back beta-sheet. The TNF-alpha analogues are used as vaccines for treatment or prevention of alpha analogues are used as vaccines for treatment or prevention of rheumatoid arthritis, Crohn's disease, ulcerative colitis, cancer of any capture. Sort, disseminated sclerosis, diabetes, psoriasis, osteoporosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Modified human tumour necrosis factor-alpha - comprises immunodominant cell epitope, useful in vaccines to treat or prevent TNF-associated diseases, e.g. cancer.

The present sequence represents a modified human tumour necrosis factoralpha analogue. The analogues have no residual TWF activity and are immunogenic in a large proportion of the human population (by using promiscuous epitopes). The TWF-alpha analogue is able to generate, in humans, neutralizing antibodies to wild-type human TWF alpha, has at least one fragment of TWF substituted by a peptide containing an immunodominant T-cell epitope, and at least one TWF-alpha B-cell epitope. The substitution causes a significant change in the amino acid sequence of any one of the strands in the front beta-sheet, any of the connecting loops or any of the B'. I or D strands in the back beta-sheet. The TWF-alpha analogues are used as vaccines for treatment or prevention of alpha analogues are used as vaccines for treatment or prevention of rheumatoid arthritis, Crohn's disease, ulcerative colitis, cancer of any contains and substitutions, cancer of any contains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a modified human tumour necrosis factoralpha (TNF-alpha) analogue. The analogues have no residual TNF activity and are immunogenic in a large proportion of the human population (by using promiscuous epitopes). The TNF-alpha analogue is able to generate, in humans, neutralizing antibodies to wild-type human TNF alpha, has at least one fragment of TNF substituted by a peptide containing an immunodominant T-cell epitope, and at least one TNF-alpha B-cell epitope. The substitution causes a significant change in the amino acid sequence of any one of the Strands in the front beta-sheet, any of the connecting loops or any of the B.' I or D strands in the back beta-sheet. The TNF-alpha analogues are used as vaccines for treatment or prevention of diseases associated with excessive release or activity of TNF-alpha, e.g. themmatoid arthritis, Crohn's disease, ulceritye colitis, cancer of any cort
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Modified human tumour necrosis factor-alpha - comprises immunodominant cell epitope, useful in vaccines to treat or prevent TNF-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present sequence represents a modified human tumour necrosis factoralpha (TNF-alpha) analogue. The analogues have no residual TNF activity and are immunogenic in a large proportion of the human population (by using promiscuous epitopes). The TNF-alpha analogue is able to generate, in humans, neutralizing antibodies to wild-type human TNF alpha, has at least one fragment of TNF substituted by a peptide containing an immunodominant T-cell epitope, and at least one TNF-alpha B-cell epitope. The substitution causes a significant change in the amino acid sequence of any one of the strands in the front beca-sheet, any of the connecting loops or any of the B'. I or D strands in the back beta-sheet. The TNF-alpha analogues are used as vaccines for treatment or prevention of alpha analogues are used as vaccines for treatment or prevention of chiseases associated with excessive release or activity of TNF-alpha, e.g. theumatoid arthritis, Crohn's disease, ulcerative colitis, cancer of any contains and contains and contains and contains and contains and contains and contains and contains and contains and contains and contains and contains and contains and contains contains and contains contains and contains contains and contains contains contains and contains contains contains and contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains contains conta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Modified human tumour necrosis factor-alpha - comprises immunodominant cell epitope, useful in vaccines to treat or prevent TNF-associated diseases, e.g. cancer.

The invention provides a pharmaceutical vaccine composition (I) for the prevention or treatment of a self-protein-mediated pathology. The composition comprises at least one modified immunogenic self-protein (selected from modified TNF-alpha proteins) and a surfactant capable of acting as a solubilizer. (I) is useful for preventing or treating a self-protein-mediated pathology such as an inflammatory disease, rhematoid arthritis, an inflammatory bowel disease (ulcerative colitis or Crohn's disease), cancer, cachexia, multiple sclerosis, diabetes, psoriasis, osteoporosis or asthma. (I) is useful for inducting automatibodies to a self-protein such as TNF (tumour necrosis factor)-alpha in a human subject. (I) comprising cetylpyridinium chloride as a component is useful inflammatory disease. The present sequence represents a human analogue TNF-alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TNF-alpha; pharmaceutical; vaccine; self-protein; tumour necrosis factor; ectylpyridinium chloride; immunisation; antiinflammatory; antiheumatic; antiatthritic; antiulcer; cytostatic; antidiabetic; antipsoriatic; antistathmatic; immunomodulator; neuroprotective; osteopathic; human;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a modified human tumour necrosis factoralpha analogue. The analogues have no residual TNF activity and are immunogenic in a large proportion of the human population (by using promiscuous epitopes). The TNF-alpha analogue is able to generate, in humans, neutralizing antibodies to wild-type human TNF alpha, has at least one fragment of TNF substituted by a peptide containing an immunodominant T-cell epitope, and at least one TNF-alpha B-cell epitope. The substitution causes a significant change in the amino acid sequence of any one of the strands in the front beta-sheet, any of the connecting loops or any of the B', I or D strands in the back beta-sheet. The TNF-alpha analogues are used as vaccines for treatment or prevention of alpha analogues are used as vaccines for activity of TNF-alpha, e.g. theumatoid arthritis, Crohn's disease, ulcerative colitis, cancer of any cancer of sorth.

prevention or treatment of a self-protein-mediated pathology. The composition comprises at least one modified immunogenic self-protein selected from modified TNF-alpha proteins) and a surfactant capable of acting as a solubilizer. (I) is useful for preventing or treating a self-protein-mediated pathology such as an inflammatory disease, rheumatoid disease, cancer, cacheria, multiple sclerosis, diabetes, psoriasis, osteoporosis or asthma. (I) is useful for inducing autoantibodies to a self-protein such as TNP (tumour necrosis factor)-alpha in a human for immunisation of a human subject or for treatment of a human analogue TNF30-5
                                       Novel vaccine composition for prevention/treatment of self-protein-mediated pathology such as cancer, diabetes and asthma, comprises modified immunogenic self-protein and surfactant capable of acting as

Novel vaccine composition for prevention/treatment of self-protein-mediated pathology such as cancer, diabetes and asthma, comprises modified immunogenic self-protein and surfactant capable of acting as solubilizer

The invention provides a pharmaceutical vaccine composition (1) for the prevention or treatment of a self-protein-mediated pathology. The composition comprises at least one medifiled immunogenic self-protein (selected from modifiled TNR-alpha proteins) and a surfactant capable of acting as a solubilizer. (I) is useful for preventing or treating a self

-protein-mediated pathology such as an inflammatory disease, rheumatoid arthritis, an inflammatory bowel disease (ulcerative colitis or Crohn's disease), cancer, cachearia, multiple sclerosis, diabetes, psoriasis, osteoporosis or asthma. (I) is useful for inducing autoantibodies to a self-protein such as TNF (tumour necrosis factor)-alpha in a human subject. (I) comprising octylpyridinium chloride as a component is useful for immunisation of a human subject or for treatment of a human inflammatory, disease. The present sequence represents a human TNF-alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention provides a pharmaceutical vaccine composition (1) for the prevention or treatment of a self-protein-mediated pathology. The composition comprises at least one medified immunogenic self-protein (selected from modified TNP-alpha proteins) and a surfactant capable of acting as a solubilizer. (1) is useful for preventing or treating a self-protein-mediated pathology such as an inflammatory disease, theumatoid arthitis, an inflammatory bowel disease (ulcerative colitis or Crohn's disease), cancer, cachexia, multiple sclerosis, diabetes, psoriasis, osteoporosis or asthma. (1) is useful for inducing autoantibodies to a self-protein such as TNF (tumour necrosis factor)-alpha in a human subject. (1) comprising cetylphyridinium chloride as a component is useful for immunisation of a human subject or for treatment of a human

AAB20144) and residues 37-51 substituted by tetanus toxin T-cell epitope P2 (See AAB20143). It is an object of the invention to produce a recombinant therapeutic vaccine that is capable of effecting down-regulation of GDP-8 in order to increase the muscle growth rate of farm animals. The vaccines (see AAB20145-53) are capable of breaking animals. The vaccines (see AAB20145-53) are capable of breaking cutoclerance against autologous GDF-8. They comprise the C-terminal portion of human GDF-8 in which a portion of the mative sequence is replaced by a T-cell epitope such as P30, with minimal disturbance of the cortion of human GDF-8 in which a portion of the minimal disturbance of the capablation of GDF-8 variants can be used for genetic immunisation of the animals. Down-regulation of GDF-8 activity can increase muscle mass by up to at the need for antibiotic feed-additives. Anti-GDF9 vaccines can be used to treat human diseases such as cancer cachexia where muscle ears to promounced and for patients suffering from acute and chronic heart
                                                                                                                                                                                                                                                                                                                                              ö

                                                                                             ligand (OPGL) and tetanus toxoid P30 epitope. Osteoprotegerin is a secreted member of the tumour necrosis factor receptor family, which blocks osteoclastogenesis in a dose dependent manner. The OPGL protein is synthesised as a type II transmembrane protein. The murine and human OPGL polypeptides are 87% homologous. OPGL is a potent osteoclast differentiation factor when combined with CSF-1. It is not capable of inducing osteoclast differentiation in the absence of CSF-1. OPGL is also an activator of mature osteoclasts. The specification describes a method for the in vivo down-regulation in the absence of CSF-1. OPGL is also mativator of mature osteoclasts. The specification describes a method comprises using at least one OPGL polypeptide or subsequence, and/or at least one OPGL polypeptide or subsequence, and/or at method and OPGL polypeptide are useful for treating, preventing and ameliorating osteoporosis or other diseases or conditions characterised by excessive bone resorption

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents fusion protein of murine osteoprotegerin is a secreted member of the tumour necrosis factor receptor family, which is a secreted member of the tumour necrosis factor receptor family, which blocks osteoclastogenesis in a dose dependent manner. The OpGL protein is synthesised as a type II transmembrane protein. The murine and human OpGL COLypeptides are 87% homologous. OpGL is a potent osteoclast the differentiation factor when combined with CSF-1. It is not capable of inducing osteoclast differentiation in the absence of CSF-1. OpGL is also an activator of mature osteoclasts. The specification describes a method for the in vivo down-regulation of OpGL activity in an animal. The method comprises using at least one OpGL polypeptide or subsequence, and/or at method and OpGL analogue to induce an immune response in the animal. The method and OpGL polypeptide are useful for treating, preventing and ameliorating osteoporosis or other diseases or conditions characterised by excessive bone resorption

The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TNP, TNFalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is human TNFalpha variant protein with an inserted tetanus toxoid P2 and P30 epitopes. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Multimeric protein; interleukin 5; ILS; TNFalpha; inflammatory disease; tumour necrosis factor alpha; gene therapy; arthritis; human; mutant; mutein; variant; tetanus toxoid; epitope.

New protein comprising at least one epitope of membrane immunoglobulin E (IGE) and being free of epitopes of serum IGE, useful for treating an IGE-mediated allergic disease or condition, e.g. asthma, allergic rhinitis
                                                                                                                                                                                                                                                                                                    The present sequence is that of a fusion construct comprising human membrane IgE (mIgE) fused at its N-terminal end to a human IgE leader sequence to enhance protein expression, and fused at its C-terminal end via a proteolytic cleavage site to tetanus toxoid (TT) Th epitope to enhance immune response, and a 6His tag sequence. A plasmid comprising DNA encoding this fusion protein was used as a DNA vaccine to immunise HIA-A2 mice. Epitope-specific responses were observed. The DNA is an example of nucleic acid molecules of the invention that encode a mIgE epitope that is free of serum IgE epitopes and which optionally includes for treating an individual susceptible to, or having, an IgE mediated allergic disease, e.g. asthma, allergic rhinitis, atopic dermatitis, anaphylaxis or urticaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mucin repeat, MUC-1 analogue, vaccination, self-protein, cancer, cytotoxic T-lymphocyte immunity, breast cancer, prostate cancer, cell-associated peptide antigen; foreign epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 209;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Indels

                                                                                                                                                                                                              The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TNP, TNPalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is human TNPalpha variant protein with an inserted teranus toxoid P2 and P30 epitopes. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                               New immunogenic analogue of a polymeric protein, useful for preparing a composition for treating inflammatory diseases e.g. arthritis.

epitope. The carrier protein comprises at least 1 of NG, N10 or N19. The carrier protein can be prepared by expressing a vector comprising a nucleic acid molecule encoding the protein, in a host cell and recovering the expressed protein. The carrier protein can also be produced by (a) constructing oligonuclectides from duplexes; (c) introducing the annealing the oligonuclectides to form duplexes; (c) introducing the duplexes into an expression vector; (d) introducing the action an expression vector; (d) introducing the expression vector; (d) introducing the expression vector; (d) introducing the expression vector into a host cell; and (e) isolating the fusion protein produced from a culture of the host cells. The carrier protein can be used as a protective immunogen in the control of diseases caused by encapsulated bacteria. The present sequence represents the amino acid sequence of N10
                                                                                                                                                                                                                                                                                                                                                                         The invention provides carrier proteins comprising at least 5 CD4+ T cell
                                                                                                                                                                                                                                                        Carrier proteins containing CD4+ epitopes useful for protecting against diseases caused by encapsulated bacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Carrier proteins containing CD4+ epitopes useful for protecting against diseases caused by encapsulated bacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Carrier protein; CD4+; T cell epitope; N6; N10; N19; immunogen; N11; encapsulated bacteria.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             u:
                                                                                                                                                                                                                                                                                                                                                                                                           This is an immunogenized MUC-1 analogue containing foreign epitopes P2 and P30. Immunogenic analogues of MUC-1 and, e.g. human prostate specific membrane antigen (hRSM) can be used in the claimed method as an authoryaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms (see features table). 10 regions suitable for the insertion of foreign T helper epitopes were identified. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. hPSM, heregulin 2 (Her2) and/or fibroblast growth factor 8b (RGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and (2) at least 1 B-cell group derived from the colling and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 human/murine FGF8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Her2, respectively. Note: This sequence does not appear in (AAY92664), P2 and P30 (AAY926525-26), which appear on pages 220, 213 and 214 respectively, of the specification
                                                                                                                                                                                                                                                                                               Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                   Dalum I;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

epitope. The carrier protein comprises at least 1 of N6, N10 or N19. The carrier protein comprises at least 1 of N6, N10 or N19. The carrier protein can be prepared by expressing a vector comprising a nucleic acid molecule encoding the protein, in a host cell and recovering the expressed protein. The carrier protein can also be produced by (a) annealing the oligonucleotide molecules that encode peptide epitopes; (b) annealing the oligonucleotides to form duplexes; (c) introducing the oligonucleotides to form duplexes; (c) introducing the into a host cell; and (e) isolating the fusion protein produced from a protective immunogen in the control of diseases caused by encapsulated bacteria. The present sequence represents the amino acid sequence of N11 polyepitope carrier protein construct ö invention provides carrier proteins comprising at least 5 CD4+ T cell Gaps ; 0 100.0%; Score 112; DB 3; Length 240; 100.0%; Pred. Increasing the muscle mass of animals used in meat production by down regulating growth differentiation factor 8 (GDF-8) activity in the animal through induction of anti-GDF-8 antibody production.

Example 1; Page 105-106; 110pp; English.

The present sequence is that of AutoVac construct GDP-8 dimer comprising 2 copies of the 109-amino acid C-terminal region of human growth differentiation factors 8 (GBF-8, see AAF2014) covalently connected through the P2 and P30 T-cell epitopes (see AAB20143-44) of tetanus corrected through the P2 and P30 T-cell epitopes (see AAB20143-44) of tetanus corrected the p2 and p30 T-cell epitopes (see AAB20145-53) are capable of effecting down-regulation of GDF-8 in order to increase the muscle growth rate of farm animals. The vaccines (see AAB20145-53) are capable of breaking autotolerance against corrected to increase the muscle growth rate of farm animals. The vaccines corrected at a portion of the native sequence is replaced by a T-cell epitope such as P30, with minimal disturbance of the authentic 3-dimensional correction of the protein. Nucleic acids encoding the GDF-8 variants can be used for genetic immunisation of the animals. Down-regulation of GDF-8 corrected for genetic immunisation of the animals. Down-regulation of GDF-8 corrected for genetic immunisation of the animals. Down-regulation of GDF-8 corrected for animals. Animic GDF-8 vaccines can be used for mast failure such than a cancer cachexia where muscle are bused to treat human diseases corrected as cancer cachexia where muscle are paint failure.

```
The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TNP, TNPalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is a fusion construct which comprises 2 human interleukin 5 (IL5) monomers joined by tetanus toxoid epitopes p30 and P2. This sequence is used to illustrate the method of the
                                                                                                                                                                New immunogenic analogue of a polymeric protein, useful for preparing a composition for treating inflammatory diseases e.g. arthritis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                 The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TNP, TNPalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is a fusion construct which comprises 2 human interleukin 5 (ILS) monomers joined by tetamus toxoid epitopes P30 and P2. This sequence is used to illustrate the method of the
                                                                                                                                                                                               New immunogenic analogue of a polymeric protein, useful for preparing a composition for treating inflammatory diseases e.g. arthritis.

The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TWF, TWRalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is a fusion construct variant which comprises 2 human interleukin 5 (IL5) monomers joined by diglycine linker and including terminally positioned tetanus toxoid epitopes P30 and P2. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           airway hyper-responsiveness, AHR; mucus hyper-secretion; goblet cell metaplasia; sub-epithelial fibrosis; skin irritation; inhaled corticosteroid; ICS; dermatological; antiasthmatic; gene therapy; chronic obstructive pulmonary disease; COPD; asthma; atopic dermatitis; murine; peptide p30.
                                                                                                                                                                                                                                                 New immunogenic analogue of a polymeric protein, useful for preparing a composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Length 287;
                                                                                                                                                              Mouritsen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Protein encoded by the expression plasmid pCDNmIbl3p30FC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      mouse; immunogenic; IL-13; interleukin-13; vaccine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8
                                                                                                                                                                                                                                                                                         The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TNP, TNPsIDha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is a fusion construct variant which comprises 2 human interleukin 5 (IL5) monomers joined by diglycine linker and including terminally positioned tetanus toxoid epitopes P30 and P2. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                      New immunogenic analogue of a polymeric protein, useful for preparing a composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Multimeric protein; interleukin 5; ILS; TNFalpha; inflammatory disease;

This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune cresponse by recognishing human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in a appropriate manner to generate a human vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 while having sufficient amino acid sequence diversity, attributable to non-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its immunosens (AIR), con-human mammalian species, to enhance its immunogenicity. Accordingly, contrast individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune compose by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate a human vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 while having sufficient animal sequence diversity, attributable to non-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its on be-peithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide murine IL-13 protein and the tetani 330 septide under the control of a control of the invention. NOTE: This sequence is given in the figure to but is not further referred to in the specification.
                                                                                                                                                                                                                                                                                                                                                                                 New vaccine composition useful for treating asthma, Chronic obstructive pulmonary disease or atopic disorders, e.g. dermatitis, comprises an immunogen generating an immune response against interleukin-13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune CC IL-13 (interleukin-13) element that is capable of driving an immune cresponse by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate a human vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 cwhile having sufficient amino acid sequence diversity, attributable to non-human mammalian species, to enhance its immunogenicity. Accordingly, cm human mammalian species, to enhance its immunogenicity. Accordingly, cm nous hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the method results in a reduction in airway hyper-responsiveness (AHR), cm ucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for that airways and skin irritation, as well as reducing the requirement for cerreat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide cmurine IL-13 protein and the tetani p30 peptide under the control of a cmv promoter of the invention. NOTE: This sequence is given in the figure ccounts is not further referred to in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         immunogenic, IL-13; interleukin-13; vaccine; airway hyper-responsiveness; AHR; mucus hyper-secretion; goblet cell metaplasia; sub-epithelial fibrosis; skin irritation; inhaled corticosteroid; ICS; dermatological; antiasthmatic; gene therapy; chronic obstructive pulmonary disease; COPD; asthma; atopic dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                New immunogenic composition comprising an interleukin-13 (IL-13) element that drives an immune response recognizing human IL-13 and foreign T-cell epitopes, useful in treating, e.g. asthma or atopic dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Protein encoded by the expression plasmid pCDNcIL13p30newFC.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        epitope. The carrier protein comprises at least 1 of N6, N10 or N19. The carrier protein comprises at least 1 of N6, N10 or N19. The carrier protein can be prepared by expressing a vector comprising a nucleic acid molecule encoding the protein, in a host cell and recovering the expressed protein. The carrier protein can also be produced by (a) constructing oligonucleotide molecules that encode peptide epitopes; (b) annealing the oligonucleotides to form duplexes; (c) introducing the duplexes into an expression vector; (d) introducing the expression vector; (d) introducing the expression vector into a host cell; and (e) isolating the fusion protein produced from a culture of the host cells. The carrier protein can be used as a protective immunogen in the control of diseases caused by encapsulated bacteria. The present sequence represents the amino acid sequence of N19 polyepitope carrier protein construct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                mouse; immunogenic; ID-13; interleukin-13; vaccine; airway hyper-responsiveness; AHR; mucus hyper-secretion; goblet cell metaplasia; sub-epithelial fibrosis; skin irritation; inhaled corticosteroid; ICS; dermatological; antiasthmatic; gene therapy; chronic obstructive pulmonary disease; COPD; asthma; atopic dermatitis; murine; peptide p30.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention provides carrier proteins comprising at least 5 CD4+ T cell
                                                                                                                                                                                                                                                                                                                                                 Carrier proteins containing CD4+ epitopes useful for protecting against diseases caused by encapsulated bacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .;

This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune CC IL-13 (interleukin-13) element that is capable of driving an immune CC response by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human conference of a human vaccine. The present inventional shape to native human IL-13 sequences as having a similar conformational shape to native human IL-13 while having sufficient amino acid sequence diversity, attributable to non-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its immunogenicity attributable to non-human mammalian species, to enhance its immunogenicity. Accordingly, concreted of skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide is the pCDNCIL13930news conservation plasmid protein sequence of the invention. NOTE: This sequence is given in the figure but is not further conservation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         airway hyper-responsiveness, ARR; mucus hyper-secretion;
goblet call metaplasia; sub-epithelial fibrosis; skin irritation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune IL-13 (interleukin-13) element that is capable of driving an immune C IL-13 (interleukin-13) element that is capable of driving an immune c epitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate c human vaccine. The present invention describes human chimeric IL-13 sequences as having similar conformational shape to native human II-13 while having sufficient amino acid sequence diversity, attributable to non-human mammalian species, to enhance its immunogenicity. Accordingly, the method results in a reduction in airway hyper-resonsses (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (CDPD), asthma or atopic dermatitis. This polypeptide is the pCDNCIL13p30newFC expression plasmid protein sequence of the invention. NOTE: This sequence is given in the figure but is not further
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   immunogenic; IL-13; interleukin-13; vaccine; airway hyper-responsiveness; AHR; mucus hyper-secretion; goblet cell metaplasia; sub-epithelial fibrosis; skin irritation; inhaled corticosteroid; ICS; dermatcological; antiasthmatic; gene therapy; chronic obstructive pulmonary disease; COPD; asthma; atopic dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                              New immunogenic composition comprising an interleukin-13 (IL-13) element that drives an immune response recognizing human IL-13 and foreign T-cell epitopes, useful in treating, e.g. asthma or atopic dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The (G+C) content of the synthetic gene is increased by 47% wrt the native sequence. This eliminates six "terminator" regions which were found to be present in (A+T) rich regions. The terminators (termination/endo-nucleolytic processing/polyadenylation sites) were previously responsible for incomplete transcription of the mRNA. The elimination of these elements (using codon degeneracy) provided for successful expression in yeast of the tetanus toxin fragment C. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                            DNA sequence encoding tetanus toxin fragment C - useful in the manufacture of vaccines for immunity to tetanus utilising yeast as host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Vaccine, shed antigen-specific B cell, idiotypic antibody, immune complex-mediated disease, autoimmune disease; tetanus protein,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune response by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate a human vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 while having sufficient amino acid sequence diversity, attributable to non-human mammalian species, to enhance its immunogenicity. Accordingly, connected a production in airway hyper-responsiveness (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide is the polominially and the tetani p30 peptide under the control of a control of a control of is the ground the tetani p30 peptide under the control of a control of is the proventive referred to in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô
                                                                                                                                                                                                                                                                                                                                                                                                                                            New vaccine composition useful for treating asthma, Chronic obstructive pulmonary disease or atopic disorders, e.g. dermatitis, comprises an immunogen generating an immune response against interleukin-13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present sequence represents a fragment of tetanus protein, which is used as an immunostimulatory protein in vaccines of the invention. The specification describes a method for inducing an immune response reactive with idiotypes present on shed antigen-specific B cells (SAB) of an individual. The method involves administering a vaccine formulation comprising polynucleotide encoding an idiotype of an antibody that binds to an epitope of shed antigen. The method is useful for inducing an immune response reactive with idiotypes present on SAB of an individual. The method is useful for depleting shed antigen-specific B cells, and for treating immune complex-mediated disease progression in organ specific autoimmune disease exacerbated by humoral immune response against groups expressed on shed antigen. Or by plasma cell production of antibodies against groups of shed antigen. It is useful in cancer therapy and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Delivery of a composition to the central nervous system or spinal cord - comprises administration of a non-toxic, proteolytic fragment of tetanus toxin in association with a molecule having biological function.
                 Inducing an immune response against shed antigen-specific B cell idiotypes, by administering a vaccine formulation comprising polymucleotides encoding an idiotypic determinant or peptides comprising

This sequence represents the tetanus toxin fragment C (TTC). The invention relates to a method for in vivo delivery of a desired composition into a human or animal central nervous system (CNS) or spinal cord comprises administering a non-toxic, proteolytic fragment of tetanus cord comprises administering a non-toxic, proteolytic fragment of tetanus cord comprises administering a non-toxic, proteolytic fragment of tetanus cord composition with at least a molecule having a biological cord interion and where the composition is capable of in vivo retrograde axonal transport and transynaptic transport into the CNS or the spinal cord of the human or animal and of being delivered to different areas of the CNS or the spinal cord. The method can be used for the treatment of thumans or animals with CNS or spinal cord diseases, can compositions (SNA) or neurodegenerative lysosomal storage faseases. Compositions comprising hybrid fragments of TT comprising and mapping and transport of the fragment inside the organism compared with

The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TNF4) pha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is human TNFAIDHa variant protein with 3 hTNF sequences joined by glycine linkers and tetahus toxoid P2 and P30 epitopes. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Multimeric protein; interleukin 5; IL5; TNFalpha; inflammatory disease; tumour necrosis factor alpha; gene therapy; arthritis; human; mutant; variant; tetanus toxoid; epitope; mutein.
                                                                                                                                                                                                                                                                                                        New immunogenic analogue of a polymeric protein, useful for preparing composition for treating inflammatory diseases e.g. arthritis.

                                                                                                                                                                                                                                                               The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TNP, TNPalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is human TNRalpha variant protein with 3 hTNF sequences joined by glycine linkers and tetamus toxoid P2 and P30 epitopes. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                       New immunogenic analogue of a polymeric protein, useful for preparing a composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Multimeric protein; interleukin 5; IL5; TNFalpha; inflammatory disease; tumour necrosis factor alpha; gene therapy; arthritis; human; mutant; variant; tetanus toxoid; epitope; mutein.

The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tummour necrosis factor alpha (TNF, TNFalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is human TNFalpha variant protein with 3 hTNF sequences joined by glycine linkers and tetanus toxoid P2 and P30 epitopes. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CEA; immune response; carcinoembryonic antigen; antigen presenting cell; APC; cytostatic; vaccine; human; tetanus toxoid; p2; p30; antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New immunogenic analogue of a polymeric protein, useful for preparing composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                100.0%; Score 112; DB 6; Length 517; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TNF, TNFalbha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is human TNFalpha variant protein. The variant comprises 3 hTNF sequences joined by glycine linkers and tetanus toxoid P2 and P30 epitopes. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                New immunogenic analogue of a polymeric protein, useful for preparing a composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Multimeric protein; interleukin 5; IL5; TNFalpha; inflammatory disease; tumour necrosis factor alpha; gene therapy; arthritis; human; mutant; variant; tetanus toxoid; epitope; mutein.

New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.
                                                                                                                                                                                                                                   Gene product comprises a tetanus toxin fragment, which may be expressed in a transformed host, and used as an antigen in vaccine production, against the disease. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Neuronal cell; binding domain; translocation domain; stroke; epilepsy; tumour; infection; neurodegenerative disease; gene therapy; chimeric; diphtheria neurotoxin; tetanus neurotoxin; TeNT.
                                                                                                                                                                  Cloned DNA sequence coding for tetanus toxin - or its fragments contg. epitope used to express antigens for vaccine prodn.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a non toxic polypeptide, for delivery of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to inducing an immune response against autologous carcinoembryonic antigen (CEA) in an animal, e.g. human. The method involves effecting uptake and processing by antigen presenting cells (APCB) in the animal of at least 1 modified CEA polypeptide or of a mucleic acid encoding the modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide to induce a CTL response and an antibody response that targets the autologous CEA. The method is useful in immunizing actively against diseases characterized by cells that express CEA. The present sequence represents a truncated human CEA polypeptide that has tetanus toxoid (TT) P2 and P30 epitopes introduced
                                                                                                                                                                                                                                                                                                                                         Inducing an immune response in humans against autologous carcinoembryonic antigen (CEA) comprises administering a modified CEA polypeptide, a nucleic acid encoding the polypeptide, or a microorganism expressing the

```
therapeutic agent to a neuronal cell, which comprises a binding domain (arboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocates the therapeutic domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful for reat disorders of the CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain fragment. This sequence is constructed by fusing the truncated binding domain of tetanus neurotoxin (TPL) with translocation domain of diphtheria neurotoxin. (Updated on 11

Brown RH, Francis JW, Fishman PS, Hosler BA;

WPI; 1998-412999/35. N-PSDB; AAV32580. New hybrid protein of superoxide dismutase and tetanus toxin fragment C - having increased uptake by neurons and retention of enzymatic activity in these cells, for treating neurological diseases associated with oxidative

```
The present sequence represents an enzymatically active human copper-zinc superoxide dismutase (SOD-1) fused at its carboxyl terminus with the tetanus toxin fragment C (TTC) moiety. The TTC moiety constitutes amino-acid residues 865-1315 of the tetanus holotoxin. The hybrid protein, referred as SOD:Tet451, is claimed to have the following properties: (a) it exhibits Cu/Zn SOD enzymatic activity; (b) the TTC moiety selectively binds to nerve cells and allows uptake of the hybrid protein into these cells; and (c) it retains substantial SOD enzymatic activity following neurological disorders associated with oxidative stress, e.g. stroke, brain hypoxia-reperfusion, epilepsy, Parkinson's and Huntington's diseases. (Updated on 17-OCT-2003 to standardise OS field)

Inducing an immune response against shed antigen-specific B cell idiotypes, by administering a vaccine formulation comprising polynucleotides encoding an idiotypic determinant or peptides comprising idiotypic determinant

Example 2; Page 73-76; 81pp; English.

The present sequence represents a fusion protein, comprising a protein used for immunising against shed antigen-specific B cells linked to a fragment of tetanus protein. It is used in vaccines of the invention. The specification describes a method for inducing an immune response reactive with idiotypes present on shed antigen-specific B cells (SAB) of an individual. The method involves administering a vaccine formulation

```
comprising polynucleotide encoding an idiotype of an antibody that binds to an epitope of shed antigen. The method is useful for inducing an immune response reactive with idiotypes present on SAB of an individual. The method is useful for depleting shed antigen-specific B cells, and for treating immune complex-mediated disease progression in organ specific autoimmune disease exacerbated by humoral immune response against groups expressed on shed antigen, or by plasma cell production of antibodies against groups of shed antigen. It is useful in cancer therapy and for treating autoimmune disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful to treat disorders of the CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours

The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells, preventing and reversing damage to cells; killing cells; promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory inhibiting and reversing damage to cells; killing cells; promoting or inhibiting and reversing or cells, and treating intracellular infection, for interfering with intracellular cell, for intracellular infection, for interfering with intracellular cell, for intracellular infection, for interfering with intracellular trafficking, for modulating expression of cell-surface markers and for inhibiting secretion from cells. The invention is also useful for treating Prion disease, Alzheimer' disease and wide range of disorders including muscle spasms such as blephorospasm, torticolis and
                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Conjugate for modulating cell survival and cell growth, modulating release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell.
    The present sequence
and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain fragment. This sequence is constructed by fusing the binding domain of tetanus neurotoxin (TeNT) with translocation domain of diphtheria neurotoxin. (Updated on 11-SEP-2003 to standardise OS field)

hypersecretion disorders such as chronic obstructive pulmonary disease (COPD), bronchitis and asthma. The present sequence is a fusion construct comprising Corymebacterium diphtheriae diphtheria toxin translocation domain (Dip-HN domain) and Clostridium tetani tetanus neurotoxin binding domain (TeNt-HC). This sequence is used in the exemplification of the invention. (Updated on 23-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Conjugate for modulating cell survival and cell growth, modulating release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells, preventing and reversing damage to cells, killing cells; promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell, for intracellular infection, for interfering with intracellular trafficking, for modulating expression of cell-surface markers and for inhibiting secretion from cells. The invention is also useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Apoptosis; therapy; inflammatory mediator; intracellular trafficking; infection; Prion disease; Alzheimer' disease; hypersecretion disorder; muscle spasm; COPD; bronchitis; chronic obstructive pulmonary disease; torticolis; blephorospasm; asthma; fusion protein; tetanus neurotoxin; diphtheria toxin; TeNT; translocation domain; HN domain; DipT; HC; binding domain.

including muscle spasms such as blephorospasm, torticolis and hypersecretion disorders such as chronic obstructive pulmonary disease (CDDD), bronchitis and asthma. The present sequence is a fusion construct comprising Corynebacterium diphtheriae diphtheria toxin translocation domain (DIPT-HN domain), Clostridium tetani tetanus neurotoxin binding domain (TeMT-Hc) and thrombin linker peptide. This sequence is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Conjugate for modulating cell survival and cell growth, modulating release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells, preventing and reversing damage to cells, killing cells, promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell, for intracellular infection, for interfering with intracellular trafficking, for modularing expression of cell-surface markers and for inhibiting secretion from cells. The invention is also useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      infection, Prion disease, Alzheimer' disease; hypersecretion disorder; muscle spasm, ODD!, Pronchitis; chronic obstructive pulmonary disease; torticolis; blephorospasm; asthma; fusion protein; tetanus neurotoxin; diphtheria toxin; TeNT; translocation domain; HN domain; DipT; HC;

c antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 E-cell group derived from the cell-associated PA, and (2) at least 1 first T helper cell group which is forthy murine FGF8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least noe foreign T helper epitopes of the respective PA and including to the treat prostate, prostate, prostate, prostate or breast cancer when the PA is human PSM, FGF8b and Har2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        tumor associated peptide

treating Prion disease, Alzheimer' disease and wide range of disorders including muscle spasms such as blephorospasm, torticolis and hypersecretion disorders such as chronic obstructive pulmonary disease (COPD), bronchitis and asthma. The present sequence is a fusion construct comprising Corynebacterium diphtheriae diphtheria toxin translocation domain (DIPT-HN domain), Clostridium tetani tetanus neurotoxin binding domain (DIPT-HN and factor Xa linker peptide. This sequence is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                             Gaps

CC AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are confirmed to the immunogenic cell-associated bends are confirmed as those associated with cancers (self-proteins), e.g. immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. thuan prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 80 (FGR8D). The method comprises effecting simultaneous presentation by antigen producing cells (APC8) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and (Or at least 18 -cell group derived from the C cell-associated PA, and (2) at least 18 -cell group which is foreign to the animal. Analogues of human PSM, human Her2 and c predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used contracted from the wild type human PSM (AAY92619), which appears on pages 184-187 cof the specification Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer. Prostate specific membrane antigen; splice variant; mutant; vaccination; cytotoxic T-lymphocyte immunity; breast cancer; prostate cancer; cell-associated peptide antigen; foreign epitope. 100.0%; Score 112; DB 3; Length 693; 100.0%; Pred. AAY92659-62 are mutant immunogenized murine prostate specific membrane antigen (PSM) constructs, which contain a foreign epitope, P30. The analogues can be used to study whether autocolerance to mouse PSM can be used to study whether autocolerance to mouse PSM can be used to broken in mice by immunisation and/or DNA vaccination against murine PSM can be used in mice by immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. The method is used for inducing immune responses against weakly immunogenic cell-cassociated peptide antigens (PA) such as those associated with cancers (CSII proteins), e.g. human PSM, heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultensous presentation by antigen producing cells (APC8) of the animals immune cystem of: (1) at least 1 18-coll group derived from the cell-associated PA; and (2) at least 1 first T helper cell group which is foreign to the infinal. Analogues of human PSM, human Her2 and human/murine FGF8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper cell comprising a substantial part of all known and predicted CTL and B-cell cepitopes are also claimed. The method is used to treat prostate, prostate, presented from the murine CRA, respectively. Note: This sequence was constructed from the murine PSM SPM splice variant (AAY92624), which appears on pages 210-213 of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Prostate specific membrane antigen, splice variant, mutant, vaccination, cytotoxic T-lymphocyte immunity, breast cancer, prostate cancer, cell-associated peptide antigen, foreign epitope.

AAY92659-62 are mutant immunogenized murine prostate specific membrane antigen (PSM) constructs, which contain a foreign epitope, P30. The canalogues can be used to study whether autocolerance to mouse PSM can be used in mice by immunisation and/or DNA vaccination against murine PSM analogues. Immunogenic analogues of PSM can be used in the claimed method as an autovoaccine to induce a CTL response. The method is used for inducing immune responses against weakly immunogenic cellassociated peptide antigens (PA) such as those associated with cancers (SAIF-protein)), e.g. human PSM, heregulin 2 (Herz) and/or fibroblast cypresentation by antigen producing cells (APCS) of the animals immune cyptem of it at least 1 B-cell group derived from the cell-associated PA and/or at least 1 B-cell group derived from the coll-associated PA and (2) at least 1 B-cell group derived from the coll-associated PA and (2) at least 1 B-cell group derived from the Goreign to the comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper CC epitopes are also claimed. The method is used to treat prostate, prostate, prostate, breast cancer when the PA is human PSM, FGFBb and Herz, respectively. Note: This sequence was constructed from the mutine constructed incorrection or energies or the expectively, which appears on pages 210-213 of the tumor associated peptide Inducing immune responses to weakly immunogenic, tumor as antigens for the treatment of breast and prostate cancer. The invention relates to inducing an immune response against autologous carcinoembryonic antigen (CEA) in an animal, e.g. human. The method involves effecting uptake and processing by antigen presenting cells (APCs) in the animal of at least I modified CEA polypeptide or of a mucleic acid encoding the modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide to induce a CTL response and an antibody response that targets the autologous CEA. The method is useful in immunizing actively against diseases characterized by cells that express CEA. The present sequence represents a modified human CEA polypeptide that has tetanus toxoid (TT) P2 and P30 epitopes introduced
                                                                              Inducing an immune response in humans against autologous carcinoembryonic antigen (CEA) comprises administering a modified CEA polypeptide, a nucleic acid encoding the polypeptide, or a microorganism expressing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Inducing an immune response in humans against autologous carcinoembryonic antigen (CEA) comprises administering a modified CEA polypeptide, a

```
The invention relates to inducing an immune response against autologous carcinoembryonic antigen (CEA) in an animal, e.g. human. The method involves effecting uptake and processing by antigen presenting cells (APCS) in the animal of at least 1 modified CEA polypeptide or of a mucleic acid encoding the modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide to induce a CTL response and an antibody response that targets the autologous CEA. The method is useful in immunizing actively against diseases characterized by cells that express CEA. The present sequence represents a modified human CEA polypeptide that has tetanus toxoid (TT) P2 and P30 epitopes introduced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Inducing an immune response in humans against autologous carcinoembryonic antigen (CEA) comprises administering a modified CEA polypeptide, a nucleic acid encoding the polypeptide, or a microorganism expressing the
 nucleic acid encoding the polypeptide, or a microorganism expressing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CEA; immune response; carcinoembryonic antigen, antigen presenting cell; APC; cytostatic; vaccine; human; tetanus toxoid; p2; p30; antigen.

The invention relates to inducing an immune response against autologous

ö

```
ö
carcinoembryonic antigen (CEA) in an animal, e.g. human. The method involves effecting uptake and processing by antigen presenting cells (APCs) in the animal of at least I modified CEA polypeptide or of a nucleic acid encoding the modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide to induce a CTL response and an antibody response that targets the autologous CEA. The method is useful in immunizing actively against diseases characterized by cells that express CEA. The present sequence represents a modified human CEA polypeptide that has tetanus toxoid (TT) P2 and P30 epitopes introduced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Dalum I;

preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APC9) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the PA and/or at least 1 First T helper cell group which is correign to the animal. Analogues of human PSM, human Her2 and human/murine FGF8b comprising a substantial part of all known and coredicted CTL and B-cell spitopes of human PSM, human Her2 and coredicted CTL and B-cell epitopes are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGP8b and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187

Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.

autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogeniz cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (FRM), hereagulin 2 (Herz) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animal immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the PA and/or at least 1 B-cell group which is forup derived from the Analogues of human PSM, human Herz and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign to the animal. Analogues of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or a last cancer when the PA is human PSM, FGF8b and Herz, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 194-187 of the specifical constitution. AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an Example 1; Page; 220pp; English. the specification Sequence 750 AA;

```
AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cystein residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immuno responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 80 (FGR8D). The method comprises effecting simultaneous presentation by antigen producing cells (APC8) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) crowing from the PA and (Or at least 1B -cell group derived from the CC animals immune system of at least 1 Eirst T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and predicted CTL and B-cell epitopes of the respective PA and including at cell-associated PA; and (1) at least of human fact of the method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGFBb and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 coff the specification

AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenized as an electronic analogues of PSM can be used in the claimed method as an attowactine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are concerned in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenize cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. thuan prostate specific membrane antigen (PSM), heregulin 2 (HBr2) and/or fibroblast growth factor 8D (FGPB). The method comprises effecting simultaneous presentation by antigen producing cells (APCB) of the alimane system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) contines immune system of: (1) at least 1 Effect T helper cell group which is group derived from the PA and/or at least 1 first T helper cell group which is coll-associated PA; and (2) at least 1 first T helper cell group which is contained. The animal Analogues of the respective PA and including at predicted CTL and B-cell epitopes of the respective PA and including at content prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8B and Herz, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187
                                                                                                                                                                                                            Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.

AAY92627-49 are mutant immunogenized human prostate specific membrane antiquen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immuno responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 80 (FGP8b). The method comprises effecting simular system of: (1) at least 1 B-cell group derived from the PA and/or at least 1 B-cell group derived from the CC animals immune system of: (1) at least 1 B-cell group derived from the CC animal. Analogues of human PSM, human Her2 and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 con the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

Prostate specific membrane antigen; immunogenized construct; mutant; vaccination; cytotoxic T-lymphocyte immunity; breast cancer; prostate cancer; cell-associated peptide antigen; foreign epitope. Mutant human prostate specific membrane antigen construct, hPSM1.1.

```
Affiliation (PSM) constructs, which contain probleme upperints memorane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with canners (Belf-proteins), e.g. thuman prostate specific membrane antigen (PSM), heregulin 2 (Herz) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting cannume system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) cannume system of: (1) at least 1 E-cell group derived from the animal. Analogues of human PSM, human Herz and chuman/murine FGF8b comprising a substantial part of all known and chuman/murine FGF8b comprising a substantial part of all known and characted of the respective PA and including at least one foreign T helper epitopes of the respective PA and including at least one foreign T helper patrope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Herz, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 of the annumed to the annumed PSM (AAY92619), which appears on pages 184-187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAY92627-49 are mutant immunogenized human prostate specific membrane
                                                                                                                                                                                                                                                                                                                                                                                                              Dalum

Mutant human prostate specific membrane antigen construct, hPSM1.8.

AAY92638 standard; protein; 750 AA.

(first entry)

10-AUG-2000

AAY92638;

```
AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenized speak can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are conserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenized peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. antigens (PA) such as those associated with cancers (self-proteins), e.g. thuman prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 80 FFFBD). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animal. Analogues of human PSM, human Her2 and cell-associated PA; and (2) at least 1 first T helper cell group which is coell-associated PA; and (2) at least 1 first T helper cell group which is coell-associated PA; and (2) at least 1 first T helper cell group which is coell-associated PA; and (2) at least 1 first T helper cell group which is coell-associated PA; and (2) at least 1 first T helper cell group which is coell-associated PA; and (2) at least 1 first T helper cell group which is coell-associated PA; and (2) at least 1 first T helper cell group which is coell-associated PA; and (2) at least 1 first T helper cell group which is coedicted CTL and B-cell epitopes of the respective PA and including at the predicted CTL and B-cell epitopes of the respective PA and including at the predicted CTL and B-cell epitopes or breast cancer when the PA is human PSM, FGF8b and Her2, respectively. Which appears on pages 184-187 of the animal type human PSM (AAY92619), which appears on pages 184-187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                  Prostate specific membrane antigen; immunogenized construct; mutant; vaccination; cytotoxic T-lymphocyte immunity; breast cancer; prostate cancer; cell-associated peptide antigen; foreign epitope.

The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Herz) and/or fibroblast growth factors BD (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 CTL (cytocoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the cell-associated PA; and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Herz and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           human/muxine FGF8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Dalum I;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAY92627-49 are mutant immunogenized human prostate specific membrane

```
AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (BSM) constructs, which contain foreign epitopes (P2 and/or P30). The fimunogenic analogues of PSM can be used in the calaimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 80 (FGFBD). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) cropped from the PA and/or at least 1 B-cell group derived from the cell-associated PA, and (2) at least 1 iffst T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Dalum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Leach D,

```

AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteliar residues involved in disulfide bonds are conferenced in the immunogenized forms. The method is used for inducing cimmune responses against weakly immunogenic cell-associated peptide cimmune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. numan proteate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 80 (FGF8D). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) croup derived from the PA and (2) at least 1 Breal group derived from the C animals immune System of: (2) at least 1 Breal group derived from the C foreign to the animal. Analogues of human PSM, human Her2 and c human/murine FGPBb comprising a substantial part of all known and c predicted CTL and B-cell epitopes of the respective PA and including at conference or from the wild type human PSM (AAM92619), which appears on pages 184-187 of the specification

human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the PA and/or at least 1 Erst T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and human/murine FGF8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast concer when the PA is human PSM, FGF8b and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY92627-49 are mutant immunogenized human prostate specific membrane

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g.
human/murine FGF8b comprising a substantial part of all known and predicted CTL and B-cell epicopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Har2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Dalum I;

The immunogenic analogues of PSM can be used in the claimed method as an autigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autigon contain the claimed method as an entergen to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide thuman prostate specific membrane antigen (PSM), heregulin 2 (Herz) and/or tiproblast growth factor 8b (PGP8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) call-associated PA; and (2) at least 1 B-cell group derived from the PA and/or at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Herz and predicted CTL and B-cell epitopes of the respective PA and including at least to the animal Theory of the respective PA and including at least to the animal Theory of the respective PA and including at least to treat prostate, prostate/breast or breast cancer when the PA is human correct prostate, prostate/breast or breast cancer when the PA is human from the wild type human PSM (AAY92619), which appears on pages 184-187 cofficention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                 Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                            immunogenized human prostate specific membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Prostate specific membrane antigen; immunogenized construct; mutant; vaccination; cytotoxic T-lymphocyte immunity; breast cancer; prostate cancer; cell-associated peptide antigen; foreign epitope.

AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenize and season in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are content of the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. antigens (PA) such as those associated with cancers (self-proteins), e.g. thuman prostate specific membrane antigen (PSM), heregulin 2 (Herz) and/or fibroblast growth factor 8D (FGP8D). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the simula system of: (1) at least 1 CTL (cytocoxic T-1ymphocyte) continuing immune system of: (1) at least 1 B-cell group derived from the CC group derived from the PA and/or at least 1 B-cell group which is coll-associated PA; and (2) at least 1 Eirst T helper cell group which is contained cTL and B-cell epitopes of the respective PA and including at contained processing a substantial part of all known and channal. Analogues of the respective PA and including at contained processing T helper epitope are also claimed. The method is used to the wild type human PSM (AAY92619), which appears on pages 184-187
                                                                                                                                                                                                                                                                                                                          Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Prostate specific membrane antigen; immunogenized construct; mutant; vaccination; cytotoxic T-lymphocyte immunity; breast cancer; prostate cancer; cell-associated peptide antigen; foreign epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Mutant human prostate specific membrane antigen construct, hPSM6.3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are concerved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide artigens (PA) such as those associated with cancers (self-proteins), e.g. numan prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or (ibroblast growth factor 8b (FGP8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) crosing derived from the PA and/or at least 1 CTL (cytotoxic T-lymphocyte) coll-associated PA, and (2) at least 1 Eirst T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and coll-associated PA, and (2) at least 1 Brack of all known and considered CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, RGP8b and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAV92619), which appears on pages 184-187 coll the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                             Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.

Location/Qualifiers WPI; 2000-349917/30. Sequence 756 AA; WO200020027-A2 05-OCT-1999; 05-OCT-1998; 20-0CT-1998; 10-AUG-2000 13-APR-2000. Synthetic. AAY92660; Query Match Key Peptide Best Loca Matches RESULT 197 AAY9266(g ò AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Herz) and/or human prostate specific membrane antigen (PSM), heregulin 2 (Herz) and/or fibroblast growth factor 80 FG788b). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animals immune system of: (1) at least 1 E-cell group derived from the PA and/or at least 1 E-cell group derived from the cell-associated PA; and (2) at least 1 E-cell group which is foreign to the animal. Analogues of human PSM, human Herz and predicted CTL and B-cell epitopes of human PSM, human Herz and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human pSM, FGF8b and Herz, respectively. Note: This sequence was constructed from the walld type human PSM (AAY92619), which appears on pages 184-187 of the specification ö Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer. Dalum I; Gaps Prostate specific membrane antigen; immunogenized construct; mutant; vaccination; cytotoxic T-lymphocyte immunity; breast cancer; prostate cancer; cell-associated peptide antigen; foreign epitope. Mutant murine prostate specific membrane antigen construct, mPSMX. ö 100.0%; Score 112; DB 3; Length 750; 100.0%; Pred. antigen (PSM) constructs, which contains a foreign epitope, P30. The analogues can be used to study whether autotolerance to mouse PSM can be used to study whether autotolerance to mouse PSM can be be used to study whether autotolerance to mouse PSM can be used in mice by immunisation and/or DNA vaccination against murine PSM using murine PSM analogues I Immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. The method is used for inducing immune responses against weakly immunogenic cell-cassociated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human PSM, heregulin 2 (Her2) and/or fibroblast growth factors B6 (FGPSB). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animal immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the cell-associated PA is and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and human/murine FGPBb comprising a substantial part of all known and predicted CTL and B-cell comprising a substantial part of all known and predicted CTL and B-cell comprising a substantial PM and including at least one foreign T helper cell group derived from the PR state of prostate, presented the method is used to treat prostate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAY92659-62 are mutant immunogenized murine prostate specific membrane antigen (PSM) constructs, which contain a foreign epitope, P30. AAY92659-62 are mutant immunogenized murine prostate specific membrane antigen (PSM) constructs, which contain a foreign epitope, P30. The analogues can be used to study whether autocolerance to mouse PSM can be used to study whether autocolerance to mouse PSM can be broken in mice by immuniation and/or DNA vaccination against murine PSM using murine PSM analogues. Immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (Self-protein)), e.g. human PSM, heregulin 2 (Harz) and/or fibroblast crystem of: (1) at least 1 Producing cells (APCs) of the animals immune the PA and/or at least 1 B-cell group derived from the cell-associated PA crystem of: (1) at least 1 B-cell group derived from the cell-associated PA and (2) at least 1 B-cell group derived from the cell-associated PA comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper CC epitope are also claimed. The method is used to treat prostate, comprising a substantial part of all known and predicted CTL and B-cell epitopes are also claimed. The method is used to treat prostate, comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper CC epitope are also claimed. The method is used to treat prostate, the PA is human PSM, FGFBb and Herz, respectively. Note: This sequence was constructed from the wild constructed from the paint mentine PSM (AAY92621), which appears on pages 204-206 of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.

The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a tractment selected from promoting or inhibiting survival of cells, promoting or preventing and reversing damage to cells; killing cells; promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular confiction and regulating nitric oxide release from cells. The invention is suseful in the manufacture of a medicament for treating a neuronal cell, for increellular infection, for interfering with intracellular cell, for incretting acception of cell-surface markers and for inhibiting secretion from cells. The invention is also useful for treating prion disease, Alzheimer disease and wide range of disorders including muscle spasms such as blophorospasm, torticols and the hypersecretion disorders such as chronic obstructive pulmonary disease (COPD), bronchitis and asthma. The present sequence is a fusion construct comprising Corpusation of cells and constructive pulmonary disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Conjugate for modulating cell survival and cell growth, modulating release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell.

The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a carget call. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells, premoting and reversing damage to cells, killing cells, promoting or inhibiting the growth of cells apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating intracellular cells, for intracellular infection, for interfering with intracellular cells, for intracellular infection, for interfering with intracellular cells, for interfering with intracellular cells, in the invention is also useful for inhibiting secretion from cells. The invention is also useful for cell-inding muscle spasms such as blephorospasm, torticolis and hypersecretion diseases. Alzheimer' disease and wide range of disorders including muscle spasms such as blephorospasm, torticolis and hypersecretion disorders such as blephorospasm, torticolis and observed comprising corpusbacterium diphtheriae diphtheria toxin translocation domain (DipT-HW domain), Clostridium tetani tetanus neurotoxin binding comprision of the invention. This sequence is used in the exemplification of the

Generating an immune response to an antigen, useful for generating desired T cell responses comprises administering an immunoglobulin having one peptide epitope of the antigen attached to the immunoglobulin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for generating an immune response to an antigen in a patient. The method comprises administering to the patient an immunoglobulin (Ig) or its portion where the Ig has at least one peptide epitope of the antigen attached to the Ig or its portion and administering the immunoglobulin or its portion in conjunction with a RNA segment. The present sequence is an antigen sequence, used to illustrate the invention.
                                                                                      Immune response; immunoglobulin; Ig; tetanus toxin.
                                                                                                                                                                                                                                                                                                                       Phillips B;

Modified clostridial heavy chain-superoxide dismutase conjugate #1. AAE07889 standard; protein; 882 AA. 01-NOV-2001 (first entry) AAE07889; RESULT 201 AAE07889

Neuronal cell; binding domain; translocation domain; stroke; epilepsy; tumour; infection; neurodegenerative disease; gene therapy; chimeric; superoxide dismutase; SOD; diphtheria neurotoxin; tetanus neurotoxin; TeNT.

Geobacillus stearothermophilus. Corynebacterium diphtheriae. Clostridium tetani. Synthetic Chimeric.

WO200158936-A2.

```
The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (acrosy terminal half of heavy chain (H) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocation domain is not a HN domain of a clostridial coning and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are cusful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful for delivering therapeutic cubstances to neuronal cells. They are useful for delivering therapeutic cubstances to neuronal cells. They are useful for delivering therapeutic cubstances to neuronal cells. They are useful in gene therapy. The present sequence of m diffection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain-superoxide dismutase conjugate. This superoxide dismutase (MnSOD), MnSOD from Bacillus stearothermophilus, linker that can be cleaved by factor Xa, translocation domain from the configuration and a neuronal cell-specific binding domain from
                                                                                                                                                                                                                                                                                                                                         New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TeNT-Hc-DipT HN domain-factor Xa linker-YopT protein fusion construct.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Apoptosis, therapy, inflammatory mediator; intracellular trafficking; infection, Prion disease, Alzheimer' disease; hypersecretion disorder; muscle spasm, CODD; bronchitis; chronic obstructive pulmonary disease; torticolis; blephorospasm; asthma; fusion protein; tetanus neurotoxin; diphtheria toxin; TeNT; translocation domain; HN domain; DipT; Hc; binding domain; targetted effector protien; YopT.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (acarboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are cusful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful for the invention are constituting neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain-euperoxide dismutase conjugate. This conjugate comprises bacterial Mn-superoxide dismutase (MnSOD), from Bacillus stearchtermophilus, linker that can be cleaved by thrombin, translocation domain from diphtherial neurotoxin and a neuronal cell-
                                                                                                                                                                                                                                                                                                                                      New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Neuronal cell; binding domain; translocation domain; stroke; epilepsy; tumour; infection; neurodegenerative disease; gene therapy; chimeric; superoxide dismutase; SOD; diphtheria neurotoxin; tetanus neurotoxin;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    à
                                                                                                                                                                                                                                                                              The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells, preventing and reversing damage to cells; killing cells; promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell; for intracellular infection, for interfering with intracellular trafficking, for modulating expression of cell-surface markers and for inhibiting secretion from cells. The invention is also useful for treating Prion disease, Alzheimer' disease and wide range of disorders increasing and including muscle spasses such as blephorospasm, toricolis and increased in the invention is also useful for increasing and including muscle spasses such as blephorospasm, toricolis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                Conjugate for modulating cell survival and cell growth, modulating release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               hypersecretion disorders such as chronic obstructive pulmonary disease (COPD), bronchitis and asthma. The present sequence is a fusion construct comprising Corymbacterium diphtheriae diphtheria toxin translocation domain (DipT-HN domain), Clostridium teranni tetanus neurotoxin binding domain (TeNT-HC), factor Xa linker peptide and Yersinia pestis targetted effector protien YopT. This sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Neuronal cell; binding domain; translocation domain; stroke; epilepsy;

The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (arboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocation domain is not a HN domain of a clostridial court and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful for teat disorders of the CS including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is C botulinum C2 enterotoxin translocation domain with tetanus
                                                                                                                                                                                                                                                                                                                                                           New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Neuronal cell; binding domain; translocation domain; stroke; epilepsy; tumour; infection; neurodegenerative disease; gene therapy; botulinum neurotoxin; tetanus neurotoxin; TeNT.

```
The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful for teat disorders of the CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is C. botulinum C2 enterotoxin translocation domain with tetanus in the exemplification of the
                                                                       New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 112; DB 4;

The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells, can inflammatory mediator from cells, division of cells, spoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell, for intracellular infection, for interfering with intracellular trafficking, for modulating expression of cell-surface markers and for inhibiting secretion from cells. The invention is also useful for treating prion disease, Alzheimer' disease and wide range of disorders including muscle spasms such as blephorospasm, torticolis and including muscle spasms such as chronic obstructive pulmonary disease (COPD), bronchitis and asthma. The present sequence is a fusion comparing comprising Corynebacterium diphtheriae diphtheria toxin translocation domain (DipT-HN domain), Clostridium teani tetanus neurotoxin binding exemplification of the invention.
                                                                       Conjugate for modulating cell survival and cell growth, modulating release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell.
                                                                                                                                                                            Example 12; Page 92-96; 130pp; English

```
The present sequence is given in a specification relating to a novel polypeptide comprising tetanus toxin (TeNT) fragment C or its immunogenic fragment. Containing a mutation in a loop region. The mutation results in a reduction in the binding of TeNT fragment C or its immunogenic fragment to gangliosides and primary motoneurones, and/or a reduction in the ability of TeNT fragment C or its immunogenic fragment to undergo retrograde transport. The polypeptide is useful for treating, preventing and reducing the susceptibility to Clostridium tetani infection in a min all and also for producing antibodies which recognise groups within TeNT polypeptides. Antibody produced against the polypeptide is also useful for treating Clostridium tetani infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New single chain polypeptides comprising clostridial neurotoxin light and heavy chains, useful as positive controls for toxin assays, or for developing vaccines against clostridial toxin.
                        New polypeptide, useful for treating infections of Clostridium tetani, comprises tetanus toxin fragment with a mutation in a loop region,.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a single chain polypeptide comprising clostridial neurotoxin light and heavy chains. The single chain polypeptide comprises 2 domains: the first domain is a clostridial neurotoxin light chain, or its fragment or variant, which is capable cleaving one or more vesicle or plasma membrane associated proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 single chain polypeptide; clostridial neurotoxin light chain; clostridial neurotoxin heavy chain; Clostridium; neurotoxin; exocy; antibacterial; vaccine; toxin assay; clostridial toxin; detection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Marks P, Sutton MJ,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8
                                                                                                                                                                                                                                                                                           The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells, preventing and reversing damage to cells, killing cells, promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular correction and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell, for intracellular infection, for interfering with intracellular trafficking, for modulating expression of cell-surface markers and for treating prion disease, Alzheimer' disease and wide range of disorders including muscle spasms such as blephorospasm, torticols and hypersecretion disorders such as chronic obstructive pulmonary disease (CC byp. bronchitis and asthma. The present sequence is a fusion construct comprising Corynebacterium diphtheria ediphtheria toxin translocation domain (JippT-HM domain), Clostridium tetani tetanus neurotoxin binding domain (TeNT-HC), thrombin linker peptide and Salmonella typhimurium truncated invasion gene D protein, SigD. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                      Conjugate for modulating cell survival and cell growth, modulating release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

c heavy chain H-N portion, or its fragment or variant, which is capable of translocating the polypeptide into a cell and/or increasing the solubility of the polypeptide compared to the solubility of the first domain on its own. The second domain lacks a functional C-terminal part of a clostridial neurotoxin heavy chain, designated H-C, which renders the polypeptide incapable of binding to cell surface receptors that are the natural cell surface receptors to which native clostridial neurotoxin heavy chain, designated H-C, which renders the natural cell surface receptors to which native clostridial neurotoxin companies. The single chain polypeptide described above. The single chain polypeptide described above. The single chain polypeptides can be used as positive controls for toxin assays, as reagent components for the synthesis of therapeutic molecules, or for developing vaccines against clostridial toxin. The polypeptides are also useful as non-toxic standards for the assessment and development of in vitro assays for detection of functional botulinum or tetanus neurotoxins in foodstuffs or environmental samples. The present sequence is used in the exemplification of the present invention. essential to exocytosis; the second domain is a clostridial neurotoxin 88888888888888888888888888888888

New recombinant multivalent protein comprising antigenic determinants derived from more than one stage in a life cycle of Plasmodium vivax, useful as a vaccine for treating, preventing and reducing malarial infection.

Claim 5; Page 39-45; 59pp; English.

The invention relates to recombinant multivalent proteins (I) that stimulate an immune response to Plasmodium vivax. (I) comprises antigenic determinants, fragments or conservative substitutions, derived from more than one stage in a life cycle of a Plasmodium vivax parasite. (I) is useful as a vaccine for stimulating an immune response, specifically a

by Plasmodium parasites, such as P. vivax. (I) is especially useful in the treatment, prevention and reduction of malarial infection, as research or diagnostic reagents for the detection of Plasmodium species in a biological sample, and for conferring immunity against multiple stages of the malarial parasite. The antibodies produced are useful for the detection or measurement of antigenic epitopes derived from one or more stages in a life cycle of a parasite, particularly P. vivax. The vaccine comprising the recombinant proteins, is cost-effective, health-promoting intervention for controlling, preventing or treating the incidence of malaria. The present sequence represents the amino acid sequence of the recombinant protein ViVaclp, a multivalent and multistage sed resistance to infecti is especially useful in vaccine against P. vivax

New recombinant multivalent protein comprising antigenic determinants derived from more than one stage in a life cycle of Plasmodium vivax, useful as a vaccine for treating, preventing and reducing malarial infection.

Claim 5; Page 48-55; 59pp; English.

The invention relates to recombinant multivalent proteins (1) that stimulate an immune response to Plasmodium vivax. (1) comprises antigenic determinants, fragments or conservative substitutions, derived from more than one stage in a life cycle of a Plasmodium vivax parasite. (1) is useful as a vaccine for stimulating an immune response, specifically a protective immune response that confers increased resistance to infection by Plasmodium parasites, such as P. vivax. (1) is especially useful in the treatment, prevention and reduction of malarial infection, as research or diagnostic reagents for the detection of Plasmodium species in a biological sample, and for conferring immunity against multiple

us-09-806-703a-14.rag

stages of the malarial parasite. The antibodies produced are useful for the detection or measurement of antigenic epitopes derived from one or more stages in a life cycle of a parasite, particularly P. vivax. The vaccine comprising the recombinant proteins, is cost-effective, health-promoting intervention for controlling, preventing or treating the health-incidence of malaria. The present sequence represents the recombinant protein. Vivac2Pp, a militarial and multistage vaccine against P. vivax 8888888888888
